

CAPACITY & RISK ASSESSMENT

Resend Email Quota

Will the conference registration flow survive the day of the event?

DATE	ACCOUNT SENDER	DETECTED PLAN	VERDICT
29 September 2026	info@ikmaglobal.com	Free	At risk on event day

BOTTOM LINE

The account is on Resend's **Free plan: 100 emails per day**, with **no overage**. That daily ceiling — not the monthly quota — is the only limit that can break the event: it is the one that stops the one-time codes, and the codes are the only way to reach `estado = 'confirmado'`, which is the gate to the live stream.

Recommendation: upgrade to Pro (\$20 for one month) and the risk disappears entirely.

1 Executive summary

The conference registration flow depends on a single external service: **Resend delivers the one-time code by email, and the code is the only way to reach** `estado = 'confirmado'`, which is the gate to the live stream. If that email cannot be sent, the attendee cannot register — and therefore cannot attend.

The account is on the **Free plan: 100 emails per day and 3,000 per month**. Monthly capacity is ample; **the daily ceiling of 100 is the real constraint**, because the Free plan has **no overage**. Once the cap is reached, Resend returns `429` and sending stops completely until 00:00 UTC.

CORRECTION TO AN EARLIER ASSESSMENT

A previous version of this analysis read the API response headers as *remaining* quota and warned that the flow would fail after roughly 60 sign-ups. **That was wrong**. The headers report *used* quota. Verified with four consecutive sends — every request increments both counters:

```
x-resend-daily-quota: 8 → 9 → 10 → 11
x-resend-monthly-quota: 63 → 64 → 65 → 66
```

The real picture is the opposite of alarming: usage today is tiny. The risk is not current consumption — it is the hard daily ceiling described in section 4.

2 Official Resend limits

Transactional email plans — the category this project uses — are billed by email volume.

PLAN	PRICE	EMAILS / MONTH	DAILY LIMIT	OVERAGE
Free ← current	\$0	3,000	100 / day	Not available
Pro	\$20 / mo	50,000	none	\$0.90 per 1,000
Pro	\$35 / mo	100,000	none	\$0.90 per 1,000
Scale	\$90 / mo	100,000	none	\$0.90 per 1,000
Scale	\$160 / mo	200,000	none	\$0.80 per 1,000
Enterprise	custom	custom	none	custom

Rules that apply to this project

- **The daily limit exists only on the Free plan.** Paid plans have no daily cap, only the monthly one. This is the single most important line in this document.
- **The daily window is a UTC calendar day (00:00–24:00 UTC)**, not a rolling 24 hours. For Venezuela (UTC–4) the counter **resets at 20:00 local time**.
- Multiple `To` / `CC` / `BCC` recipients count as separate emails. We send one email per recipient, so this does not affect us.
- Received (inbound) emails also count against the quota.
- **Overages exist only on paid plans**, capped at 5× the monthly quota. Once that is reached, sending is paused until the next billing cycle.
- Rate limit: **10 requests per second per team**. Our sending loop is sequential (awaited per recipient), so it stays far below this.

3 Current measured usage

Measured live on 29 September 2026 via an API call from the project environment.

11

USED TODAY

of a 100/day ceiling

66

USED THIS MONTH

of 3,000/month

100

DAILY CEILING

hard stop, no overage

The `x-resend-daily-quota` header is returned **only to Free plan users**, which is how the plan was identified. **Both figures mean “used”**. The account is nowhere near its limits today.

VERIFICATION LIMITATION

The API key in this project is **restricted to sending only** (it returns `401 restricted_api_key` for `/domains` and `/emails`). This report therefore **cannot read the plan from the API**; the plan was inferred from the presence of the daily-quota header. **Confirm it on the Resend Usage page before the event.**

4 Risk on the day of the conference

What a single registration costs

EVENT	EMAILS
One new registration	1
A user who mistypes the code and requests a resend	+1 each
A user who never verifies and starts over later	+1 each
Reminder broadcast to all registrants (admin panel)	+1 per registrant
Membership invitation broadcast (admin panel)	+1 per registrant

Where it breaks

THE FAILURE MODE IS LOST ACCESS, NOT A DELAYED EMAIL

The rule for this conference is that `estado = 'confirmado'` is the gate to the live stream, and `confirmado` is reachable **only** by entering the emailed code. **If the code email cannot be sent, that person cannot register, and therefore cannot get in.** There is no fallback path in the current design.

SCENARIO, SAME UTC DAY	EMAILS NEEDED	FREE PLAN	OUTCOME
60 registrations, nothing else	60	✓	Fine
90 registrations + 30 resends	120	✗	30 people blocked
150 registrations	150	✗	50 people blocked
80 registrations + reminder to 300 registrants	380	✗	Blocked early in the day

TIMING TWIST FOR VENEZUELA

Because the daily window is UTC, **the quota resets at 20:00 Venezuela time**. Two consequences:

- A morning or afternoon registration rush can exhaust the 100 and block people **until 8 PM**.
- An evening event receives a fresh block of 100 **mid-event**, which can mask the problem during testing and then bite during the next day's registrations.

How a failure would present itself

- **To the attendee:** *"We couldn't send the email. Please try again in a moment."* A generic message that names no cause and invites a retry that will also fail. Several people retrying also consumes resend-cooldown slots without sending anything.
- **To the operator:** the admin panel reports *"Stopped: Resend quota exhausted"* when it sees a `429`. However, **the registration flow itself only logs to the server console** — it is not visible from the admin panel, so the first symptom of an exhausted quota would be attendees complaining.

5 Recommendation

UPGRADE TO RESEND PRO (\$20 / MONTH) FOR THE MONTH OF THE CONFERENCE

- It removes the daily ceiling entirely — the only limit that can realistically break the event. 50,000 emails is far beyond what a single conference needs.
- One month costs **\$20** against the risk of attendees being unable to register and therefore unable to join the stream.
- It also enables overages (5× the monthly quota) — a second safety net the Free plan does not have.

If staying on the Free plan is a requirement, the following operating rules become mandatory:

1. **Never send a broadcast campaign on the same UTC day as a registration push.** Keep one 100-email day and one campaign day, separated by midnight UTC.
2. **Keep registrations under roughly 80 per UTC day** to leave room for resends.
3. **Watch the counter during the day**, not after it.

6 Monitoring

- **Usage page** — resend.com/settings/usage. Authoritative; it cannot be read with a send-only API key.
- **Logs filtered to failures** — resend.com/logs?status=429 shows exactly when the quota began rejecting sends.
- **In our own data:** `select * from conferencia.envios where ok = false;` lists every failed campaign send with its HTTP status and error body.

Suggested improvement, not yet implemented

Surface quota exhaustion where it is actionable. When `solicitarCodigo` fails to send because of a `429`, log a distinguishable error rather than falling into the generic `sendFailed` branch, and show a notice in `/admin/conferencia` — for example *"Resend quota exhausted: N registrations in the last hour could not receive their code."* As it stands, OTP failures reach only the server console.
